

DATA SHEET

Venafi TLS Protect

Protect TLS Machine Identities and Prevent Certificate-Based Outages

Key Features

Discover all certificates

Continuously discover and validate all TLS certificates across your extended network.

Issue certificates

Issue TLS certificates through integration with multiple Certificate Authorities (CAs) or using the built-in CA in TLS Protect Cloud.

Empower owners

Give application owners and developers safe, self-service ability to request and manage TLS certificates when and where they're needed.

Verify security compliance

Ensure all certificates have proper ownership, attributes and configuration from the CAs you have chosen and vetted.

Eliminate errors

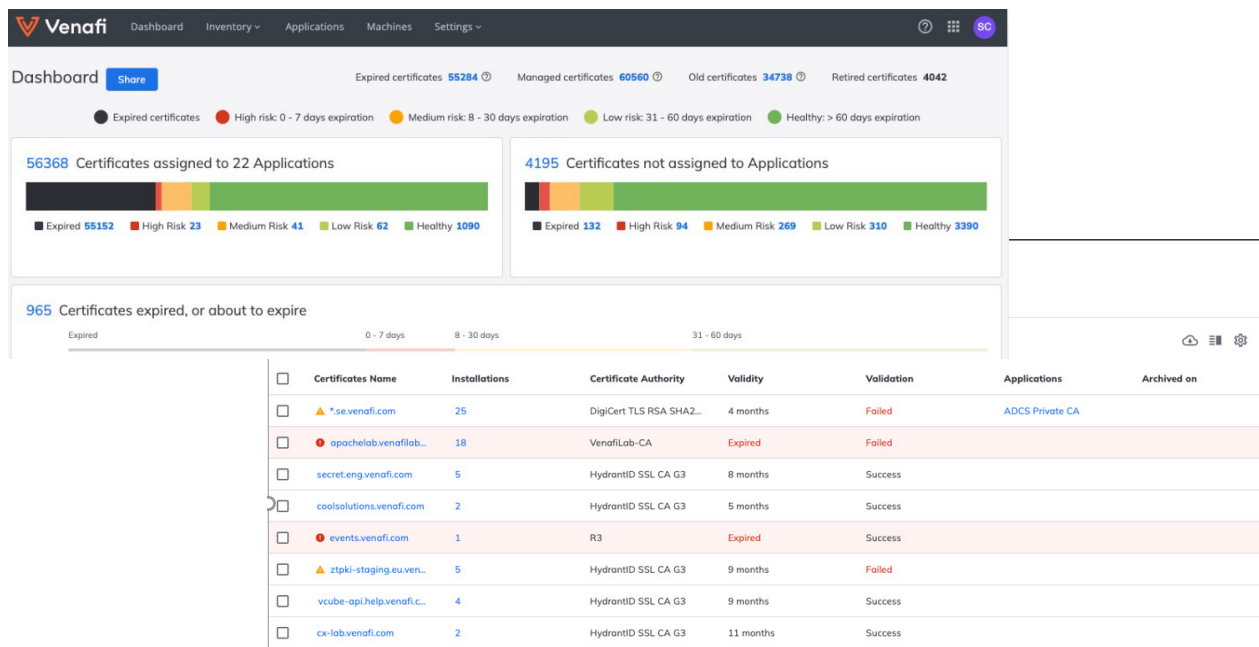

Eliminate outages caused by human errors by automatically generating public and private keys, installing them and performing renewals before certificates expire.

Machines are driving significant advances in business growth and agility. But before machines can communicate privately and securely, they need machine identities to identify, authenticate and secure machine-to-machine communications. Just as people rely on usernames and passwords to identify and authenticate themselves, machines rely on cryptographic keys and digital certificates to serve as their identities. This includes TLS certificates used for authentication, encryption and decryption.

The unprecedented expansion in the number of machines requiring TLS identities, the increasing speed at which these identities are being created and changed, and the growing variety of machine types that need identities to communicate securely make it increasingly difficult to manage and protect machine-to-machine communication.

Venafi TLS Protect

Venafi TLS Protect, part of the Venafi Control Plane for machine identities, allows security teams, application owners and developers to effectively keep up with the rapid growth of TLS machine identities to prevent outages, while at the same time improve security by minimizing risks introduced by humans and manual processes. TLS Protect identifies all TLS keys and certificates, continually validates that they are installed and operating properly, and automates the entire TLS machine identity lifecycle.

Why use Venafi TLS Protect?

Stop Outages: TLS Protect discovers all TLS machine identities, provides knowledge on which are about to expire and can fully automate the TLS machine identity lifecycle process to eliminate outages to applications, services and security infrastructure.

Automate for Efficiency: TLS Protect offers end-to-end automation across the TLS machine identity lifecycle (acquire, renew, approve, install, validate) integrated into a broad and deep ecosystem of technology partners and innovative developers to ensure organizations have the speed and efficiency they require for digital transformation.

Modernize with Speed and Agility: TLS Protect offers deep integrations with modern DevOps tooling and cloud platforms so that organizations can deliver faster, more secure cloud and DevOps and so that development teams can be #fastsecure.

Prevent Misuse and Compromise: TLS Protect provides intelligence on the security risks from

discovered TLS machine identities (e.g., key length, key strength, cipher strength) and alerts on deviations from security policy to prevent malicious or unintended use.

Ready to get started?

TLS Protect is available as-a-service or to run in your data center. Go to <https://venafi.com/try-venafi/tls-protect/> to start a free 30-day trial.

The Venafi Control Plane

The Venafi Control Plane for machine identities accelerates digital transformation and eliminates security incidents and revenue stream disruptions caused by machine identity security failures. With comprehensive support for all machine identities in data centers, clouds, hybrid environments and at the edge, Control Plane gives enterprises the observability, consistency, reliability and freedom of choice needed to stop outages, automate for efficiency, prevent misuse and compromise and modernize with speed and agility.

Venafi, a CyberArk company, delivers comprehensive solutions for PKI, certificate management and workload identity management. Through centralized visibility and automation, Venafi secures machine identities across enterprise networks. Together with CyberArk, we provide the world's first end-to-end machine identity security platform, addressing today's challenges while anticipating future needs. **To learn more, visit venafi.com**
